

# HERITEDGE

## Cost Estimation & Deployment Budget

**Project:** HeritEdge — Preserve Today. Transmit Tomorrow.

**Objective:** A digital platform for discovering, documenting and preserving India's cultural heritage and traditions.

### 1. Prototype Cost

The prototype is designed to keep initial expenditure low by using open-source technologies and available free-tier services.

| Component                       | Estimated Cost                   |
|---------------------------------|----------------------------------|
| Domain name                     | ■800 – ■1,200 / year             |
| Cloud hosting                   | ■0 – ■5,000 / year initially     |
| Database                        | ■0 – ■5,000 / year initially     |
| Storage / CDN                   | ■0 – ■5,000 / year initially     |
| API / AI services               | ■0 – ■10,000+ depending on usage |
| Estimated prototype expenditure | ■0 – ■5,000                      |

### 2. Initial Production Deployment

For an initial public deployment serving a small-to-moderate user base, the following is a practical annual planning estimate. Actual costs will vary with traffic, media storage, database size and API/AI consumption.

| Cost Area                          | Estimated Annual Budget  |
|------------------------------------|--------------------------|
| Domain                             | ■800 – ■1,200            |
| Hosting / server                   | ■2,000 – ■5,000          |
| Database                           | ■2,000 – ■5,000          |
| Media storage / CDN                | ■1,000 – ■5,000          |
| APIs / AI services                 | ■4,000 – ■10,000+        |
| Estimated initial production total | ■10,000 – ■30,000 / year |

### 3. Scalability & Cost Drivers

As the platform grows, the primary variable costs will be cloud compute, database capacity, image/video storage, bandwidth and AI/API calls. Infrastructure can therefore be scaled according to actual usage

and adoption.

#### 4. Cost-Optimization Strategy

- Use open-source frameworks and libraries wherever practical.
- Start with free tiers and low-cost cloud resources.
- Optimize and compress uploaded media.
- Use caching/CDN to reduce repeated requests and bandwidth.
- Monitor API and AI consumption and apply usage limits where appropriate.
- Scale infrastructure progressively as the user base increases.

#### 5. Cost Summary

**Prototype:** approximately ■0–■5,000 in initial expenditure.

**Initial production deployment:** approximately ■10,000–■30,000 per year, depending on usage.

Note: The figures above are planning estimates for an initial deployment. Actual vendor pricing and usage-based charges may vary.
